

## *sceye-document entry*

### **Stop the paper tourism**

Paper is travelling - from the client to the tax consultant, from Mr. Smith to Mrs. Miller or from one department to another. Especially the small receipts, the bills and stapled pages are routed through the company up to the booking department.

Invoices, petrol receipts, credit card statements, bank accounts - they all fill up numberless folders before they are sent to the accounting. But don't forget your own copy for your own folder...

Because of this large number of different kind of documents the traditional way to scan with adf-scanners is difficult and time consuming. Releasing staples, unfolding papers, gluing small receipts on big papers - all this is unnecessary with sceye.

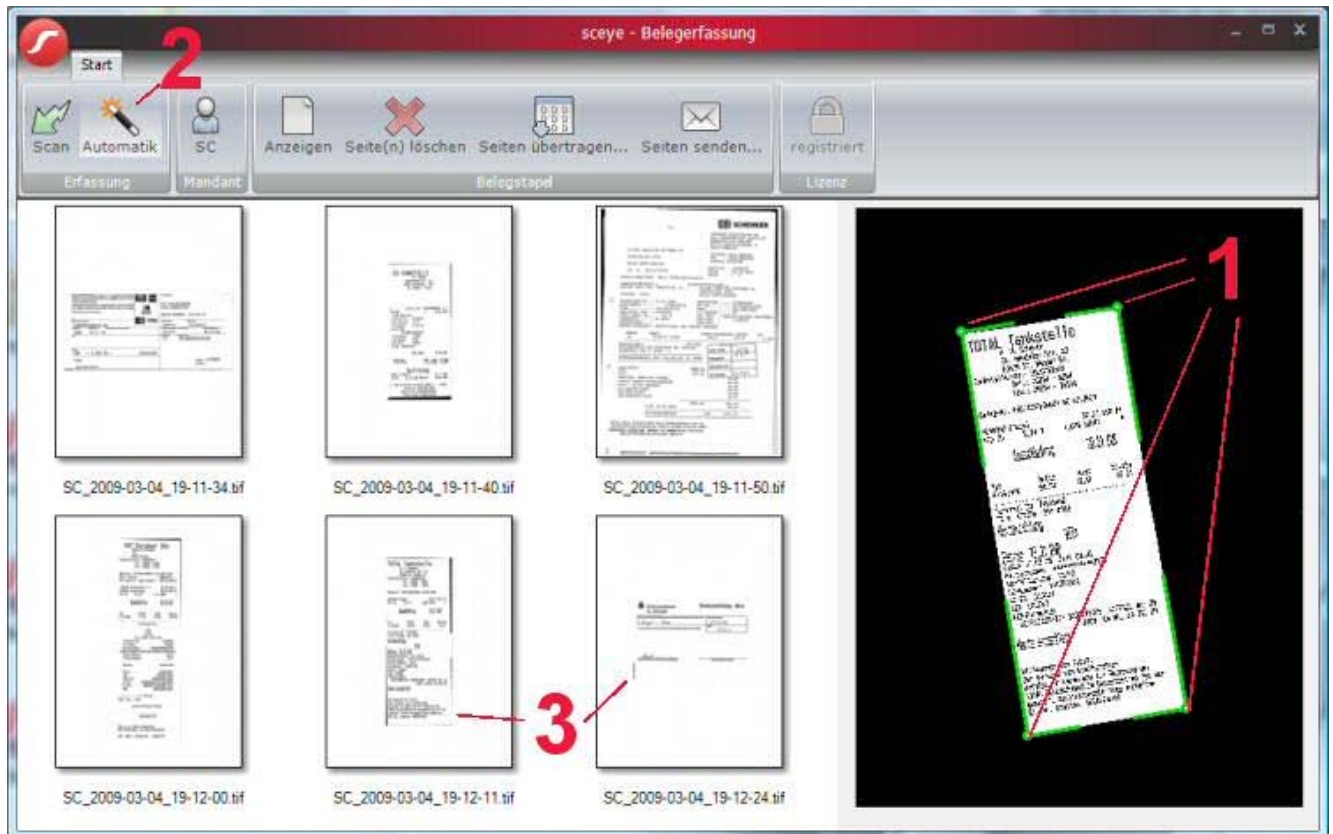

Capture your documents right from the folder, just turn over stapled pages, put small tickets right under the camera. Sealed documents - no problem anymore.

### **Appliance**

With the autodetection (1), sceye is able to recognize itself as soon as a new paper is coming in the scan area. Without doing anything, sceye is scanning (2) the paper. The captured document will be rotated and cropped automatically (3) - Done.

To save all pages in a standardized way, sceye can virtually glue smaller objects into the mid of a white and clean paper.

That way, it's easy to capture 12 documents per minute - very quick, easy and comfortable.

### 3 tips to scan quick and efficient

- Use the scan-pad with the white sticker - this allows a quick and save autodetection of the pages.
- Put small papers careless under the sceye - the pages will be rotated and cropped automatically.
- Check for the laser - as soon as the laser is switched on again, you can put the next page under the sceye.

**sceye document entry: Probably your most important step to a paperfree office!**
